

**Note**

- (1) This exam consists of 8 problems.
- (2) Calculators, notes, books, etc., may not be used.
- (3) Do not hand in scrap, etc., and when handing in  $n \geq 1$  sheets, number them  $1/n, \dots, n/n$ .
- (4) Justify your answers!
- (5) Throughout this exam,  $K = \{0, 1\}$ .

**Problems**

- (1) For each of the following linear codes, explain either why it cannot exist, or construct an example. If you give an example, do show that your code has the right properties.
  - (a) An  $(11, 5, 5)$ -code.
  - (b) A  $(7, 4, 4)$ -code.
- (2) Let  $H$  be a matrix with as rows all the elements in  $K^7$  of odd weight.
  - (a) Verify that  $H$  satisfies the conditions to be a parity check matrix for a binary linear code  $C$ .
  - (b) What is the rate of  $C$ ?
  - (c) Determine  $d(C)$ .
  - (d) Compute how many received words for  $C$  can be decoded under IMLD where we correct any error of weight at most 1. Do not simplify your answer to a number.
- (3) Let  $F = GF(2^3)$  be constructed using the primitive irreducible polynomial  $1 + x + x^3$  and let  $\beta$  be the class of  $x$ .
  - (a) Find a parity check matrix  $H$  (with entries in  $K$ ) for the cyclic Hamming code  $C$  of length 7 with generator polynomial  $m_\beta(x)$ .
  - (b) Decode the received word  $w = 1010010$  for this code.
- (4) Let  $C$  be the smallest cyclic linear code in  $K^{14}$  that contains  $x^{10} + x^2 + 1$ .
  - (a) Determine the generator polynomial of  $C$ .
  - (b) Determine the dimension of  $C$ .
- (5) **The two parts of this problem are independent of each other.**
  - (a) Factorize  $f(x) = x^8 + x^7 + 1$  into irreducibles in  $K[x]$ . (You may use without proof which polynomials in  $K[x]$  are irreducible for degrees 1, 2 and 3.)
  - (b) Determine the number of idempotents  $I(x)$  in  $K[x]$  modulo  $1 + x^{21}$ , and use this to determine the number of divisors in  $K[x]$  of  $1 + x^{42}$ .

Please turn over for problems (6), (7) and (8).

In problems (6) and (7),  $GF(2^4)$  is constructed as  $K[x]$  modulo  $1+x+x^4$  and  $\beta$  is the class of  $x$ , so  $1+\beta+\beta^4=0$ . Moreover,  $\beta$  is primitive, and the table for its powers is:

0000	-	1101	$\beta^7$
1000	1	1010	$\beta^8$
0100	$\beta$	0101	$\beta^9$
0010	$\beta^2$	1110	$\beta^{10}$
0001	$\beta^3$	0111	$\beta^{11}$
1100	$\beta^4$	1111	$\beta^{12}$
0110	$\beta^5$	1011	$\beta^{13}$
0011	$\beta^6$	1001	$\beta^{14}$

- (6) Let  $\beta$  and  $GF(2^4)$  be as in the table, let  $\alpha = 1 + \beta^7$ , and let  $m_\alpha(x)$  be the minimal polynomial of  $\alpha$  in  $K[x]$ .
  - (a) Determine the degree of  $m_\alpha(x)$  in an efficient way.
  - (b) Find  $m_\alpha(x)$  explicitly.
- (7) Let  $\beta$  and  $GF(2^4)$  be as in the table. Let  $C \subseteq K^{15}$  be the 2-error correcting BCH code with parity check matrix

$$H = \begin{bmatrix} 1 & 1 \\ \beta & \beta^3 \\ \beta^2 & \beta^6 \\ \vdots & \vdots \\ \beta^{14} & \beta^{42} \end{bmatrix}.$$

If  $w$  is a received word, determine if  $d(v, w) \leq 2$  for some  $v$  in  $C$  in two cases:

- (a)  $w$  has syndrome  $wH = [s_1, s_3] = [0, \beta^3]$ ;
  - (b)  $w$  has syndrome  $wH = [s_1, s_3] = [\beta^3, 1]$ .
- (8) Let  $n = 121$ .
- (a) Perform the Miller-Rabin probabilistic primality test for  $n$  with  $a = 3$ .
  - (b) Which conclusions can be drawn from the result in (a) concerning if  $n$  is prime or not?
