## Coding and cryptography Assignment 3

## Due 11:00am Tuesday 4th April 2023

- This assignment is *compulsory*: in order to pass the course you need to score at least 55% on both this assignment and the written exam.
- You have to do this assignment on your own. You may not discuss with other people.
- You are not allowed to use computer programs, etc.
- This assignment must be handed in as a single pdf file on canvas. If the pdf is a scan, please make sure the text is readable. Photographs are highly discouraged.
- If you have any questions, email Ronen at r.z.brilleslijper@vu.nl.

Let  $F = GF(2^6)$  be K[x] modulo the primitive polynomial  $h(x) = 1 + x + x^3 + x^4 + x^6$ , and let  $\alpha$  be the class of x. The table below gives the binary representation of  $0, 1, \alpha, \alpha^2, \ldots, \alpha^{62}$ .

1. Using (clever and efficient) calculations, check from scratch that the entries in the table for  $\alpha^{13}$  and  $\alpha^{26}$  are correct.

Let  $\beta = \alpha^7$  so that  $1, \beta, \dots, \beta^8$  are all distinct and  $\beta^9 = 1$ . Let

$$g(x) = (\beta + x)(\beta^2 + x)(\beta^3 + x)(\beta^4 + x)$$
.

Then g(x) is the generator polynomial of a Reed-Solomon code RS(9,5) over F with length n=9 and distance 5. (Note that this is the general case of Reed-Solomon codes where  $\beta$  is not necessarily a primitive element of  $GF(2^6)$ .) In problem 2 below, you have to use the algorithms treated in the course to decide if a received word w can or cannot be corrected to a codeword v by correcting at most two errors, and carry out this correction where it is possible.

- **2a.** Compute the error locator polynomial  $\sigma(z)$  using the first method (as in Section 6.3) if the syndromes of a received word  $w_1$  are  $s_1 = \alpha^{37}$ ,  $s_2 = \alpha^{23}$ ,  $s_3 = \alpha^9$  and  $s_4 = \alpha^{58}$ . Determine if  $w_1$  can be corrected, and, if so, carry out this correction.
- **2b.** Compute the error locator polynomial  $\sigma(z)$  using the first method (as in Section 6.3) if the syndromes of  $w_2$  are  $s_1 = \alpha^{53}$ ,  $s_2 = 0$ ,  $s_3 = \alpha^{32}$  and  $s_4 = \alpha^{62}$ . Determine if  $w_2$  can be corrected, and, if so, carry out this correction.
- **2c.** Use the transform method (as in Section 6.4) to determine if  $w_3$  can be corrected, and, if so, carry out this correction, if  $w_3$  has syndromes  $s_1 = \alpha^{41}$ ,  $s_2 = \alpha^{62}$ ,  $s_3 = \alpha^{20}$  and  $s_4 = \alpha^{41}$ .
- **3.** Decrypt the message (2,23) under ElGamal with  $p=41, \alpha=7,$  and private key a=13.
